

Cancer and other tumours of the stomach

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1903 Excerpt: ...increase of the debility and cachexia, and death usually ensues within a fortnight of its development. Diagnosis.--A gastro-colic fistula is seldom difficult to recognise when accompanied by fecal vomiting or lenteric diarrhoea, but when it merely produces an unpleasant odour in the breath or the vomit it is liable to be overlooked. Reeves was the first to notice that enemata are often vomited if much force has been employed in their administration; and this fact is of considerable value in diagnosis, since the rejection of a coloured fluid soon after it has been injected into the bowel necessarily indicates the existence of an abnormal communication between the colon and the stomach. In one case v. Ziemssen was able to detect the fistula by observing that when gas was introduced into the rectum it escaped into the stomach without distending the colon. According to Levinstein, loud gurgling sounds may be heard over the site of the fistula upon auscultation of the abdomen. The formation of a fistula between the stomach and the small intestine can only be surmised by the sudden subsidence of vomiting and other symptoms of dilatation of the stomach, and their replacement by diarrhoea. (2) Gastro-cutaneous Fistula.--This condition is much less frequent as the result of cancer than of simple ulcer of the stomach, and occurs in only 0-26 per cent. of the cases of the former disease (vide p. 51). It is interesting to observe that out of the nineteen cases which have been recorded, fourteen occurred in women and only five in men, the average age in the former sex being forty-two and in the latter fifty-six years. In every instance the formation of the fistula

was preceded for some time by a palpable tumour, which usually occupied the umbilical region, but occasion...
